Lesson Overview: Retrieving Data - Transfer Protocols

Description:

In this lesson, we'll learn how to navigate and implement FTP, NFS, SMB, FTPS, and SFTP for data transfer. With this knowledge, we'll be equipped with a broad understanding of how to securely and efficiently move data across networks, interact with databases, and utilise web services, enhancing our capabilities in data engineering and web development.

Learning Objectives:

By the end of this lesson, you should be able to:

Master Data Transfer Protocols

Understand the various data transfer protocols and their inherent security features.

Implement Secure Data Transfer

Learn to apply secure and efficient methods for transferring data across different networks.

Configure NFS in AWS

Gain practical experience in setting up and configuring Network File System (NFS) within an AWS environment.

Ready to Dive In?

Reflect:
Have you ever downloaded a large file, synced a shared drive, or connected to a remote server? What do you think determined how that data moved — and what could go wrong if the wrong protocol or no encryption was used?
