Docker Images

Understanding how to efficiently create, manage, and distribute Docker images is crucial for any developer or data professional looking to streamline application deployment and collaborate effectively.

In this lesson, we'll cover the end-to-end process of working with Docker images—from creation using Dockerfile to sharing via Docker Hub. By mastering Dockerfile syntax and Docker Hub operations, we'll be able to build tailored Docker images for our projects and contribute to the global Docker community, enhancing both personal and collaborative development workflows.

What You'll Learn:

- **Dockerfile Basics**

Understand Dockerfile Syntax and utilize essential commands (FROM, RUN, CMD, COPY, EXPOSE) to create Docker images.

Building Custom Images ✖

Assemble custom Docker images for applications and resolve common construction errors.

Managing Docker Hub Images ✖

Search, pull, and push Docker images to and from Docker Hub, understanding repository management.
