Creating DAGs in Apache Airflow

Description:
In today's data-driven landscape, mastering Apache Airflow and understanding Directed Acyclic Graphs (DAGs) are essential for anyone involved in managing and optimizing complex data workflows. Apache Airflow offers robust capabilities for scheduling, monitoring, and managing workflows, making it an invaluable tool for those responsible for maintaining efficient data operations.

In this lesson, we'll delve into creating and managing Directed Acyclic Graphs (DAGs) in Apache Airflow.

A DAG (Directed Acyclic Graph) in Airflow is a collection of tasks with defined dependencies and execution order—used to automate workflows like ETL pipelines, reporting jobs, or data syncing tasks.

What You'll Learn:

Build and extend DAGs

> Develop and manage Airflow DAGs, implementing task dependencies, and extending workflows as per new specifications.

Monitor and troubleshoot workflows ✖

> Employ various methods and views within Airflow to monitor DAG performance, analyse dependencies, and troubleshoot issues.

Schedule and execute pipelines ✖

> Learn how to schedule DAGs using intervals or CRON syntax and execute pipelines reliably across environments.

Apply DAG best practices ✖

> Understand and apply best practices for writing maintainable, scalable, and fault-tolerant DAGs.

Ready to dive in?

Reflect:
How have you currently structured your data workflows? Could Airflow help improve reliability, scheduling, or scalability in your current or future projects?
